

PRIVATE AI TRADING ASSISTANT

The Helm

A private assistant that runs on your own computer. It watches your live trading charts, asks an AI for trade ideas, keeps an honest record of how your real trades performed, and - only if you choose - can help place trades for you.

Runs on your PC

Watches your charts

AI trade ideas

Your choice of AI

Honest real-trade results

What the tool does

Your charts go in; clear trade ideas and honest results come out on screen - all on your own computer.

1. Watch

The tool follows your trading chart. Each time a price bar finishes, it takes a snapshot along with the key market details.

100%

of the app runs on your computer - only the AI you pick can reach out, and even that can stay local

2. Ask the AI

An AI looks at that snapshot and suggests a possible trade - buy or sell, where to get in, where to set a safety exit, a profit target, and why.

1

single program runs the whole thing, so it's simple to start and stop

3. Decide & Measure

A dashboard shows each suggestion, your real trades, your profit or loss, and what's happening in the markets that day. You always make the final call.

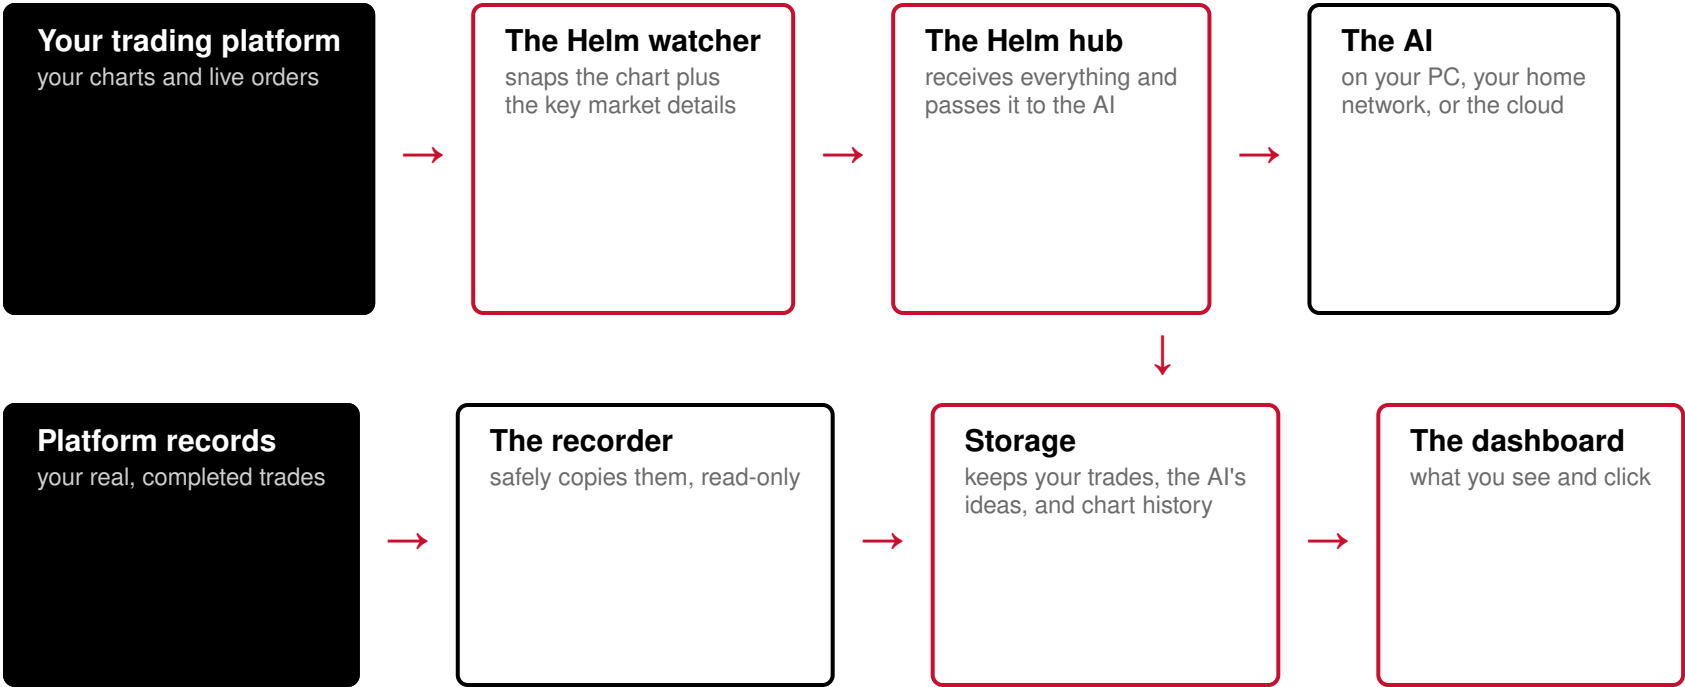

0

trades happen on their own - nothing is placed unless you approve it

HOW IT WORKS

How the pieces fit together

Information flows in one direction: from your chart, to the AI, to a dashboard you read.

Red = The Helm's own parts • **Black** = your trading platform • it all runs together as one program on your computer.

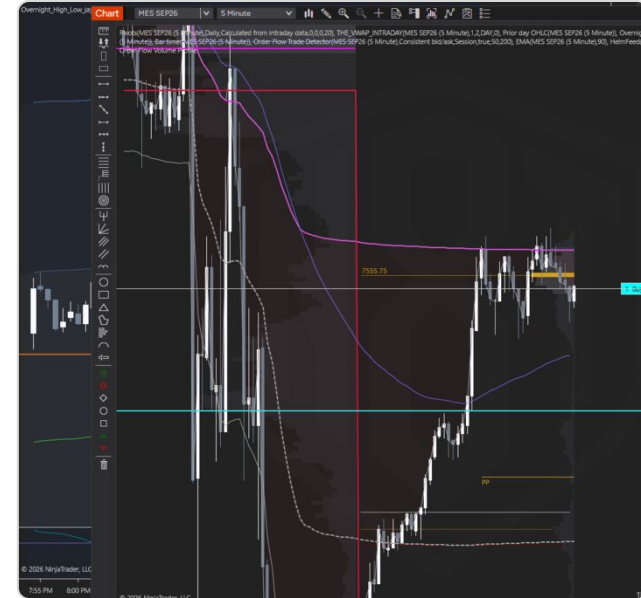

Two ways to ask the AI

On demand

Press **Ctrl+Shift+F** on any chart, drag a box around what you want looked at, and the AI reads it. About one second once it's warmed up.

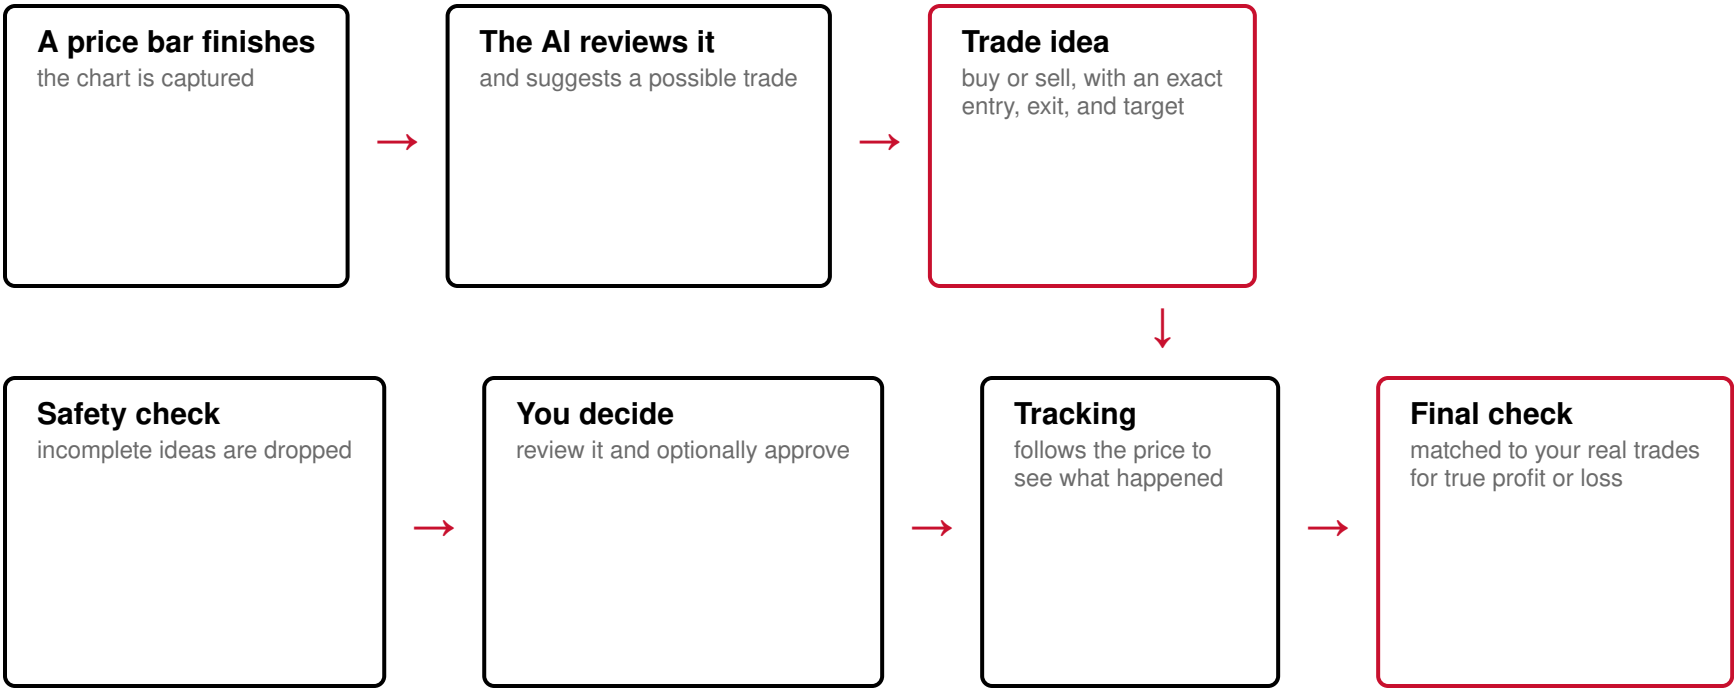

On a schedule (hands-off)

Let it check your charts on its own at a set pace. It steps aside during the market's quiet maintenance hours, ignores a frozen feed, and won't pile on new ideas while you're already in a trade.

What the AI actually sees - a live chart snapshot with your indicators and key price levels.

From chart snapshot to real profit or loss

Only real trades count

If a suggestion never became an actual trade, there's nothing to measure - no pretend results.

Order matters

A trade is only counted as a win or loss after you've actually entered it - never before.

Handles partial exits

If you take some profit early and let the rest run, both parts are tracked correctly.

You pick the brain - and where it runs

The AI is the only part that can reach beyond your computer, and it's entirely your choice whether it does.

On your computer

A free AI model (Ollama) runs right on your PC.
Fully private - nothing about your charts ever leaves the machine.

On your home network

Run that same AI on a spare computer with a good graphics card, and point The Helm at it.
Still all within your own walls.

In the cloud

Prefer no setup and top-tier vision? Use Claude or OpenAI with a paid key. Convenient, but the chart is sent to that service.

You can even mix them - a private local model for reading charts, and a cloud model for digesting the day's economic news.

The piece that watches your chart

What it sends to the AI

- Every finished price bar, with a chart snapshot and market details
- Live price movement, sent continuously as the market moves
- A keyboard shortcut to grab the chart any time you want an instant read

The market details it includes

- Trend strength and direction in the bigger picture
- Important daily price levels and overnight highs and lows
- Signals about shifts in the market's direction that traders watch

Good to know

- **After an update**, the new version has to be copied into your trading platform and the platform restarted - otherwise it keeps running the old one.
- It works safely even with several charts open at once, and won't double-count anything.
- It only reports the same information you can see on your own chart, so you can always check what the AI is looking at.

Six screens, one window

Home

What's happening in the markets today, how each account is doing, your totals, and whether the AI is actively watching.

Trade Performance

Every real trade, with profit or loss worked out, win rate, and charts of how you're doing over time.

Signal Analysis

Every AI idea in a sortable list with how each turned out. Click one for the full chart, the reasoning, and a manual outcome override.

Health

A live "is everything running?" screen showing the tool is responding quickly.

Settings

Everything you can adjust - the AI, your accounts, news, look and feel, and all the safety limits.

Support

Help, troubleshooting, recommended settings, and one-click updates - all in one place.

Everything opens in your web browser on your own computer. Trading days are counted from **5 PM Central** (when the futures market resets), not midnight.

It never shows made-up results

How it stays honest

- It matches each AI idea you actually traded to your real broker records.
- If the two ever disagree, **your real result wins** - the displayed win or loss flips to match your account.
- If it can't confidently match a trade, it says so plainly instead of guessing a number.
- Every correction is written to a log you can open and read.

Why it matters

Your profit and loss come from **what really happened in your account** - not from a simulation or an estimate.

This runs quietly on its own every hour, and you can also trigger a fresh check any time.

Real numbers, clearly shown

The headline stats

Win rate, profit factor, average win vs. loss, and your best and worst trades - at a glance.

Your equity curve

A running line of your profit over time, plus how far you dipped along the way.

Broken down

See your results by market, by strategy, and by account - so you know what's actually working.

Prop-account tracking

Starting balance, daily and trailing drawdown, and how close you are to a profit target.

Honest partial exits

Take-profit and the "runner" are shown separately, not blended into one confusing average.

Pre-trade context

The Home page shows the day's high-impact economic events before you trade.

It only acts when you say so

The safeguards

- **You approve each idea individually** - nothing is automatic.
- It starts switched **OFF** and places practice (pretend) trades only by default.
- Locked to one account you choose; it refuses to touch any other.
- Only one trade per market at a time.
- Auto-shutoff if your balance hits a floor you set, or you reach a daily loss limit.
- An idea expires if it isn't filled within your time window.

The principle

The tool proposes; you decide. Always.

Nothing ever fires on its own. The helper only acts on trade ideas you've personally approved.

Easy to set up, easy to keep current

One-click install

A single installer sets everything up on Windows and gets the dashboard, recorder, and chart tools in place for you.

Runs in the background

It starts quietly whenever your trading platform opens and shuts down when you close it - no fiddling needed.

One-click updates

When a new version is ready, a banner appears. Click it and the app downloads, rebuilds, and restarts itself in seconds.

Your private info stays private

Passwords and account numbers live in a private file on your computer that's never shared or uploaded.

WHAT WE STAND FOR

What never changes

Yours to keep private

The app runs entirely on your computer. Keep the AI local too and nothing ever leaves your machine - or opt into cloud AI if you'd rather. Your call, always.

You're in command

It's called The Helm for a reason. The AI gives advice; you steer and make every decision.

Real numbers, not guesses

Your profit and loss come from your actual trades, double-checked - never from estimates or assumptions.

Simple and dependable

Straightforward beats clever and complicated. Your data stays on your computer, in one easy-to-run program.
